

Error

1. At row 35 there's wrong assertion text. "address" should contain only two "s".

Comments

1. To make code less and simpler I'd delete highlighted part and just add everything from fixture to `cypress/e2e/pages/loginPage.ts`

2. If we're testing login procedure we should start "beforeEach" with login page, not with the main. I would changed that.

3. Not really understand for what purpose repository contains `cypress/e2e/tests/myAccount.test.ts`. If there's no tests of baseURL website, it's better to delete it.
4. Some page objects which are related to login page are in `cypress/e2e/pages/myAccountPage.ts`. I think it's better not to separate them. All stuff about login page should be in one page object.
5. Better not to use in validation text elements, because it works only while localization is ENG. Better use something more universal like id or class.

```
public validateSuccessfulLogin() {  
  this.pageHeading.should('have.text', 'My account')  
}
```

```
get alertBox() { return cy.get('p:contains("error")') }
```
